Portfolio Reflection Addendum

As part of your course portfolio, which is one component of the final exam, I would like you to include a brief reflection, preferably no more than one page, connecting three new key experiences in this edition of the course:

- the midterm exam, especially the analytical problems on LLMs and hybrid systems;
- your essay and debate on the question: *Is AI real intelligence that is artificial?*;
- your overall learning experience in ICOM5015/CIIC5015.

Your reflection should explain how your thinking about AI has evolved during the course. You may address questions such as:

- How did your view of AI as “intelligence” change after studying and using LLMs?
- What limitations of LLMs became evident to you?
- How do classical AI methods, such as search, rational agents, and rule-based reasoning, address some of those limitations?
- Why are hybrid systems, combining LLMs with structured reasoning and validation, important?

This reflection can become a valuable professional asset. In industry, employers increasingly value graduates who can use AI tools critically, responsibly and ethically. In research, questions about intelligence, reasoning, explainability, and hybrid AI remain central and rapidly evolving.

The goal is not merely to say that you used AI, but to demonstrate how your comprehension of AI changed in this course, and understand when AI works, when it fails, and how better AI systems can be designed.

Acknowledgment of AI Use and Academic Integrity

In preparing this portfolio reflection, you, the students, may use generative AI tools, including Large Language Models, as learning aids, writing assistants, tutors, or critical-thinking sparring partners. However, all submitted work must represent the student's own understanding, judgment, and intellectual responsibility.

Any use of AI tools must be acknowledged clearly and honestly. The acknowledgment should identify the tool used, describe how it was used, and explain the extent to which it contributed to the final work. Students and any person using AI remain responsible for verifying the accuracy, relevance, originality, and appropriateness of all submitted content.

This requirement is consistent with the ethical principles of transparency, accountability, and academic integrity reflected in IEEE-style scholarly practice and in the University of Puerto Rico's expectations for responsible academic work.

A suitable acknowledgment may follow this format:

I used *[name(s) of AI tool(s)]* to help, individually or in combination, with brainstorming, clarifying ideas, revising wording, testing counterarguments for this reflection. The final organization, interpretation, examples, and conclusions are my own. I reviewed and edited the AI-assisted output to ensure accuracy, originality, and consistency with the course concepts and academic integrity expectations.

Failure to acknowledge substantial AI assistance, or submitting AI-generated content without verification and personal intellectual contribution, may be treated as a violation of academic integrity.
